FROM: Mark Mixner  
Vice President for Administration & Finance  
DATE: August 3, 2015  
SUBJECT: UPDATE #2: Important Health Notice  

This update provides further information about remediation efforts the University is taking regarding the legionella bacteria that was found in the cooling towers of some of the buildings on campus. As mentioned in the previous update, the cooling towers with legionella bacteria were treated last week. Today, those cooling towers were re-tested to confirm that the treatment was fully effective. Test results will be available in approximately 1 ½ weeks, at which time I will provide those results to the campus community. Since legionella bacteria exist naturally in the environment, the University also will be sanitizing other areas to help safeguard the health of our community.
